

CenturyLink Private Line DS-3

Improve the cost efficiency and performance of your network

Benefits

- Reliably transport high traffic volume between locations
- Economically optimize your network as you configure end-user services
- Aggregate lower-speed DS-1 services for cost savings
- Gain high levels of system availability at 99.83%
- Graduated discounts based on contract length
- Single solution for integrating voice, video and data applications
- Supports in-demand business applications that require high bandwidth and fiber-optic reliability
- Capacity to accommodate growing future demands
- Reliable transmissions on your most critical circuits with optional self-healing alternate route protection service
- Service guarantee for provisioning and repair

High-speed digital transport for voice, video and data

If you're relying on multiple low-speed services to handle your growing voice, data and video traffic—or if you simply require more robust bandwidth—Private Line DS-3 can improve the cost efficiency and the performance of your network by aggregating services onto a high-speed digital backbone. The end-to-end digital transmission is clean and pure—free of cross talk, amplified noise and distortion.

This advanced digital communications solution is designed and deployed to help support your mission-critical business functions and applications including:

- Local-area, metropolitan-area and wide-area networking
- Remote workplace solution
- Remote database backup
- Computer-aided design and manufacturing (CAD/CAM) application
- Video and audio conferencing
- Centralized networking data processing

Description

Private line DS-3 is a point-to-point, high-capacity, digital private line transport service used to transfer large amounts of information between locations. With it, you have the flexibility to configure communications services and economically optimize networks, such as the aggregation of lower-speed services (e.g., DS-1, 1.544Mbps) onto a high-speed digital backbone. The DS-3 can also be channelized to provide two DS-1 circuits with the multiplexing ability to enable a platform for voice, video and data services.

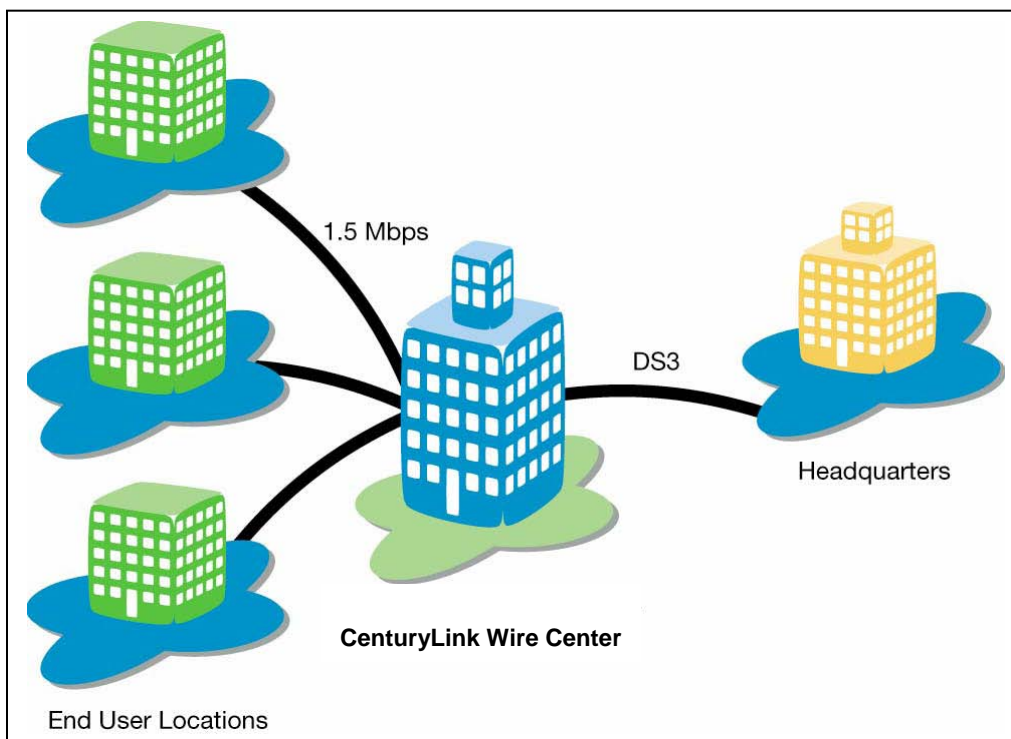

Features

- Electrical interface offered for single DS-3 applications
- Central office multiplexing provides 28 DS-1 circuits
- Self-healing alternate route protection (SHARP) protects the local loop
- SHARP Plus extends protection to the interoffice portion of the circuit
- Command-a-Link™ provides circuit reconfiguration

How it works

Private Line DS-3 consists of a high-capacity channel provisioned for transmission speeds of 44.736Mbps isochronous serial data. Private Line DS-3 is offered as an electrical interface for single DS-3 applications.

Multi-point circuit

Why CenturyLink?

- Provides the SHARP option, which allows instantaneous service restoration
- Service level agreements (SLAs) guarantee high standards of performance
- Flexible pricing plans offer discounts and protection from price increases
- A facilities-based telecommunication provider with a legacy of experience and service

Other CenturyLink products

- Synchronous Service Transport (SST)
- Self-Healing Network Service (SHNS)
