

CenturyLink International Private Line Services

Private Lines for private data

Sleep well knowing your company's international communication system is up and running and unauthorized users can't access your private information. International Private Line Services can give you peace of mind, knowing your internal traffic is being transmitted securely on an end-to-end private connection.

Extend your global reach

International Private Line Services provides international connectivity between the U.S. and major cities around the world. Asia-bound circuits pass through the CenturyLink West Coast gateway for trans-Pacific transport and termination on our AsiaLink® network. The AsiaLink® Private Line network includes coverage for Australia, Hong Kong, Singapore and Tokyo. We also offer private line services to Europe and other countries around the world through strategic relationships. Service to these locations is provided to CenturyLink by third-party global service providers that have award-winning networks and long-standing business relationships with CenturyLink.

Secure, fast and flexible connections

Speed, power, flexibility and the bandwidth required to accommodate today's business applications are some of the benefits. Other benefits include:

- **Security** – fiber optic synchronous optical network (SONET) and synchronous digital hierarchy (SDH)-protected circuits are highly resistant to tampering, providing an extra level of security and restorability
- **Reliability** -- high standards of accuracy and system availability, including 99.95% availability for point-of-presence (POP)-to-POP service; monitoring of a single circuit—rather than multiple dedicated lines—can make it faster to diagnose problems
- **Expandability** -- transmission capabilities can readily expand to meet changing requirements; multiple DS-1s and DS-3s can be upgraded to high-speed services quickly and easily
- **Cost-effectiveness** -- competitively priced and specifically designed to meet your requirements; fixed-amount billing simplifies budgeting (no sudden increases associated with variable-cost plans)

Service is available to all destinations at DS-1 (1.5Mbps) and DS-3 (45Mbps) levels. Availability of speeds varies by service location. For instance:

- To Europe and Asia, service is available at the E-1 (2Mbps) level
- Within Europe, E-1 and DS-3 services are available
- OC-3/STM-1 (155Mbps) speeds are available to many locations
- OC-12/STM-4 (622Mbps) speeds are available to certain destinations on an individual case basis

All this and simplicity too

With our Europe and Asia networks, we are able to offer you seamless connectivity to major international markets. You do not have to worry about managing multiple providers. We can be your single point of contact, which means you will receive a single bill, in a single currency, in a single language, with a single phone number to call for all your service needs.
