

CenturyLink® Hosted VoIP (BroadSoft)

Hosted VoIP offers advanced, cloud-based calling features over CenturyLink's privately owned fiber network using the geo-redundant BroadSoft BroadWorks platform for added business continuity and security. CenturyLink Hosted VoIP scales easily and includes all upgrades and improvements at no additional cost.

Hosted VoIP helps your business maximize its return on investment by delivering all the PBX features and functionality you expect without the capital expense of purchasing hardware or the ongoing operational expense of managing and maintaining that hardware. CenturyLink® Hosted VoIP allows you to converge your separate voice and data networks and get an easy-to-use-and-deploy VoIP solution that can scale to respond to changing business needs and seasonality.

Built on the BroadSoft BroadWorks platform, CenturyLink Hosted VoIP allows your business to display a single dial plan for the entire company, even if employees are geographically distributed or work remotely. Employees can now make and receive calls with the mobile devices they use today, and enjoy the same features as their office phones.
